Package 'rvest'

August 29, 2016

Version 0.3.2				
Title Easily Harvest (Scrape) Web Pages				
Description Wrappers around the 'xml2' and 'httr' packages to make it easy to download, then manipulate, HTML and XML.				
Depends R (>= $3.0.1$), xml2				
Imports httr (>= 0.5), selectr, magrittr				
Suggests testthat, knitr, png, stringi (>= 0.3.1), rmarkdown, covr				
Encoding UTF-8				
License GPL-3				
LazyData true				
VignetteBuilder knitr				
RoxygenNote 5.0.1				
<pre>URL https://github.com/hadley/rvest</pre>				
<pre>BugReports https://github.com/hadley/rvest/issues</pre>				
NeedsCompilation no				
Author Hadley Wickham [aut, cre], RStudio [cph]				
Maintainer Hadley Wickham <hadley@rstudio.com></hadley@rstudio.com>				
Repository CRAN				
Date/Publication 2016-06-17 08:57:12				
R topics documented:				
encoding . google_form . html . html_form . html_nodes . html_session .				

2 encoding

html_table	7
html_text	8
jump_to	9
pluck	0
session_history	0
set_values	.1
submit_form	.1

Index 13

encoding

Guess and repair faulty character encoding.

Description

These functions help you respond to web pages that declare incorrect encodings. You can use guess_encoding to figure out what the real encoding is (and then supply that to the encoding argument of html), or use repair_encoding to fix character vectors after the fact.

Usage

```
guess_encoding(x)
repair_encoding(x, from = NULL)
```

Arguments

x A character vector.

from The encoding that the string is actually in. If NULL,

stringi

These function are wrappers around tools from the fantastic stringi package, so you'll need to make sure to have that installed.

```
# A file with bad encoding included in the package
path <- system.file("html-ex", "bad-encoding.html", package = "rvest")
x <- read_html(path)
x %>% html_nodes("p") %>% html_text()

guess_encoding(x)
# Two valid encodings, only one of which is correct
read_html(path, encoding = "ISO-8859-1") %>% html_nodes("p") %>% html_text()
read_html(path, encoding = "ISO-8859-2") %>% html_nodes("p") %>% html_text()
```

google_form 3

google_form

Make link to google form given id

Description

Make link to google form given id

Usage

```
google_form(x)
```

Arguments

Χ

Unique identifier for form

Examples

```
google_form("1M9B8DsYNFyDjpwSK6ur_bZf8Rv_04ma3rmaaBiveoUI")
```

html

Parse an HTML page.

Description

html is deprecated: please use read_html() instead.

Usage

```
html(x, ..., encoding = "")
## S3 method for class 'response'
read_xml(x, ..., encoding = "", as_html = FALSE)
## S3 method for class 'session'
read_xml(x, ..., as_html = FALSE)
```

Arguments

x	A url, a local path, a string containing html, or a response from an httr request.
	If x is a URL, additional arguments are passed on to GET().
encoding	Specify encoding of document. See iconvlist() for complete list. If you have problems determining the correct encoding, try stri_enc_detect

as_html Optionally parse an xml file as if it's html.

4 html_form

Examples

html_form

Parse forms in a page.

Description

Parse forms in a page.

Usage

```
html_form(x)
```

Arguments

Х

A node, node set or document.

See Also

```
HTML 4.01 form specification: http://www.w3.org/TR/html401/interact/forms.html
```

```
html_form(read_html("https://hadley.wufoo.com/forms/libraryrequire-quiz/"))
html_form(read_html("https://hadley.wufoo.com/forms/r-journal-submission/"))
box_office <- read_html("http://www.boxofficemojo.com/movies/?id=ateam.htm")
box_office %>% html_node("form") %>% html_form()
```

html_nodes 5

html_nodes

Select nodes from an HTML document

Description

More easily extract pieces out of HTML documents using XPath and css selectors. CSS selectors are particularly useful in conjunction with http://selectorgadget.com/: it makes it easy to find exactly which selector you should be using. If you have't used css selectors before, work your way through the fun tutorial at http://flukeout.github.io/

Usage

```
html_nodes(x, css, xpath)
html_node(x, css, xpath)
```

Arguments

x Either a document, a node set or a single node.

Nodes to select. Supply one of css or xpath depending on whether you want to use a css or xpath 1.0 selector.

html_node vs html_nodes

html_node is like [[it always extracts exactly one element. When given a list of nodes, html_node will always return a list of the same length, the length of html_nodes might be longer or shorter.

CSS selector support

CSS selectors are translated to XPath selectors by the **selectr** package, which is a port of the python **cssselect** library, https://pythonhosted.org/cssselect/.

It implements the majority of CSS3 selectors, as described in http://www.w3.org/TR/2011/REC-css3-selectors-20110929/. The exceptions are listed below:

- Pseudo selectors that require interactivity are ignored: :hover, :active, :focus, :target, :visited
- The following pseudo classes don't work with the wild card element, *: *:first-of-type, *:last-of-type, *:nth-of-type, *:nth-last-of-type, *:only-of-type
- It supports : contains(text)
- You can use !=, [foo!=bar] is the same as :not([foo=bar])
- :not() accepts a sequence of simple selectors, not just single simple selector.

6 html_session

Examples

```
# CSS selectors -----
ateam <- read_html("http://www.boxofficemojo.com/movies/?id=ateam.htm")</pre>
html_nodes(ateam, "center")
html_nodes(ateam, "center font")
html_nodes(ateam, "center font b")
# But html_node is best used in conjunction with %>% from magrittr
# You can chain subsetting:
ateam %>% html_nodes("center") %>% html_nodes("td")
ateam %>% html_nodes("center") %>% html_nodes("font")
td <- ateam %>% html_nodes("center") %>% html_nodes("td")
td
# When applied to a list of nodes, html_nodes() returns all nodes,
# collapsing results into a new nodelist.
td %>% html_nodes("font")
# html_node() returns the first matching node. If there are no matching
# nodes, it returns a "missing" node
if (utils::packageVersion("xml2") > "0.1.2") {
  td %>% html_node("font")
}
# To pick out an element at specified position, use magrittr::extract2
# which is an alias for [[
library(magrittr)
ateam %>% html_nodes("table") %>% extract2(1) %>% html_nodes("img")
ateam %>% html_nodes("table") %>% `[[`(1) %>% html_nodes("img")
# Find all images contained in the first two tables
ateam %>% html_nodes("table") %>% `[`(1:2) %>% html_nodes("img")
ateam %>% html_nodes("table") %>% extract(1:2) %>% html_nodes("img")
# XPath selectors -----
# chaining with XPath is a little trickier - you may need to vary
# the prefix you're using - // always selects from the root noot
# regardless of where you currently are in the doc
  html_nodes(xpath = "//center//font//b") %>%
  html_nodes(xpath = "//b")
```

html_session

Simulate a session in an html browser.

Description

Simulate a session in an html browser.

html_table 7

Usage

```
html_session(url, ...)
is.session(x)
```

Arguments

url Location to start session... Any additional httr config to use throughout session.x An object to test to see if it's a session.

Methods

A session object responds to a combination of httr and html methods: use cookies(), headers(), and status_code() to access properties of the request; and html_nodes to access the html.

Examples

```
# http://stackoverflow.com/questions/15853204
s <- html_session("http://hadley.nz")
s %>% jump_to("hadley-wickham.jpg") %>% jump_to("/") %>% session_history()
s %>% jump_to("hadley-wickham.jpg") %>% back() %>% session_history()
s %>% follow_link(css = "p a")
```

html_table

Parse an html table into a data frame.

Description

Parse an html table into a data frame.

Usage

```
html_table(x, header = NA, trim = TRUE, fill = FALSE, dec = ".")
```

Arguments

X	A node, node set or document.
header	Use first row as header? If NA, will use first row if it consists of tags.
trim	Remove leading and trailing whitespace within each cell?
fill	If TRUE, automatically fill rows with fewer than the maximum number of columns with NAs.
dec	The character used as decimal mark.

8 html_text

Assumptions

html_table currently makes a few assumptions:

- No cells span multiple rows
- Headers are in the first row

Examples

```
tdist <- read_html("http://en.wikipedia.org/wiki/Student%27s_t-distribution")
tdist %>%
  html_node("table.infobox") %>%
  html_table(header = FALSE)

births <- read_html("https://www.ssa.gov/oact/babynames/numberUSbirths.html")
html_table(html_nodes(births, "table")[[2]])

# If the table is badly formed, and has different number of rows in
# each column use fill = TRUE. Here's it's due to incorrect colspan
# specification.
skiing <- read_html("http://data.fis-ski.com/dynamic/results.html?sector=CC&raceid=22395")
skiing %>%
  html_table(fill = TRUE)
```

html_text

Extract attributes, text and tag name from html.

Description

Extract attributes, text and tag name from html.

Usage

```
html_text(x, trim = FALSE)
html_name(x)
html_children(x)
html_attrs(x)
html_attr(x, name, default = NA_character_)
```

Arguments

x A document, node, or node set.

trim If TRUE will trim leading and trailing spaces.

name Name of attribute to retrieve.

default A string used as a default value when the attribute does not exist in every node.

jump_to 9

Value

html_attr, html_tag and html_text, a character vector; html_attrs, a list.

Examples

```
movie <- read_html("http://www.imdb.com/title/tt1490017/")
cast <- html_nodes(movie, "#titleCast span.itemprop")
html_text(cast)
html_name(cast)
html_attrs(cast)
html_attr(cast, "class")</pre>
```

jump_to

Navigate to a new url.

Description

jump_to() takes a url (either relative or absolute); follow_link takes an expression that refers to a link (an <a> tag) on the current page.

Usage

```
jump_to(x, url, ...)
follow_link(x, i, css, xpath, ...)
```

Arguments

X	A session.
url	A URL, either relative or absolute, to navigate to.
	Any additional httr configs to apply to this request.
i	You can select with:
	an integer selects the ith link
	a string first link containing that text (case sensitive)
CSS	Nodes to select. Supply one of css or xpath depending on whether you want to use a css or xpath 1.0 selector.
xpath	Nodes to select. Supply one of css or xpath depending on whether you want to use a css or xpath 1.0 selector.

```
s <- html_session("http://hadley.nz")
s <- s %>% follow_link("github")
s <- s %>% back()
s %>% follow_link("readr")
```

session_history

pluck

Extract elements of a list by position.

Description

Extract elements of a list by position.

Usage

```
pluck(x, i, type)
```

Arguments

x A list

i A string or integer.

type Type of output, if known

 ${\tt session_history}$

History navigation tools

Description

History navigation tools

Usage

```
session_history(x)
back(x)
```

Arguments

x A session.

set_values 11

set_values

Set values in a form.

Description

Set values in a form.

Usage

```
set_values(form, ...)
```

Arguments

form Form to modify

... Name-value pairs giving fields to modify

Value

An updated form object

Examples

```
search <- html_form(read_html("http://www.google.com"))[[1]]
set_values(search, q = "My little pony")
set_values(search, hl = "fr")
## Not run: set_values(search, btnI = "blah")</pre>
```

 $submit_form$

Submit a form back to the server.

Description

Submit a form back to the server.

Usage

```
submit_form(session, form, submit = NULL, ...)
```

Arguments

session	Session to submit form to.
form	Form to submit
submit	Name of submit button to use. If not supplied, defaults to first submission button on the form (with a message).
	Additional arguments passed on to GET() or POST()

submit_form

Value

If successful, the parsed html response. Throws an error if http request fails. To access other elements of response, construct it yourself using the elements returned by submit_request.

```
test <- google_form("1M9B8DsYNFyDjpwSK6ur_bZf8Rv_04ma3rmaaBiveoUI")
f0 <- html_form(test)[[1]]
f1 <- set_values(f0, entry.564397473 = "abc")</pre>
```
